DNA encoding NADP-GDH alpha and beta sub-units - isolated from Chlorella sorokiniana algal protoplast(s), useful to modulate nitrogen metabolism plant cells.

CC cDNA clones (AAT64542 and AAT64543) respectively code for the alpha CC subunit (AAW15407) and beta subunit (AAW15408) precursor proteins of an camonium-inducible, chloroplast-localised NADP-specific glutamate CC ammonium-inducible, chloroplast-localised NADP-specific glutamate CC dehydrogenase (NADP-GDH) of Chlorella sorokiniana. They were obtd. by CC ligation of 3' clone pBGDc53 (AAT64511) and 5' clones pGDc63 (AAT64540) and pGDc64 (AAT64541). The proteins are processed to yield mature alpha CC and beta subunits (see also AAT64547-48) that comprise the active NADP-CC GDH hexameric isoenzymes. The nitrogen metabolism of plants can be CC modulated (pref. by increasing assimilation of inorganic N into organic CC N) by transforming them with nucleotide sequences encoding the alpha CC and/or beta subunits. Such plants show improved properties, e.g. C increased crop yield and improved stress tolerance. Heterohexamers having CC alpha and beta subunits can be expressed that have higher capacity for glutamate continuing:deaminating activity ratios (i.e. higher capacity for glutamate continuing capacity ratios (i.e. higher capacity for glutamate continuing capacity ratios (i.e. higher capacity for glutamate capacity for glutama

The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the coding sequence of Chlorella sorokiniana NADP-glutamate dehydrogenase ligation construct of pBGDC53 plus pGDC64, used in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 음 성
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         문
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     밁
              The present invention relates to increasing or decreasing the nitrogen metabolism in plant cells by transforming a plant cell with a polymucleotide encoding a polypeptide having glutamate dehydrogenase (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36709, ADQ36731), or their fragments, which exhibite GDH activity. The polymucleotide is operably linked to a polymucleotide encoding a chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is useful for increasing or decreasing the nitrogen metabolism in plant cells. The
                                                                                                                                                                                                                                                                             Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nitrogen metabolism; plant; glutamate dehydrogenase; GDH; enzyme; alpha subunit; NADP-specific GDH; NADP-specific glutamate dehydrogenase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADQ36706

The present sequence is the coding sequence for the precursor protein of the alpha subunit of the NADP-specific GDH, which is then processed to produce to mature alpha subunit of the NADP-specific GDH, used in the method of the contraction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2124

It comprises the complete 3'-terminal region of the C. sorokiniana NADP-GDH sequence. 5' terminal regions were obtd. by PCR, yielding full-length clones (AAT64542-43) for the alpha and beta subunits of C. sorokiniana NADP-GDH. The method is used to provide plants with increased yield, improved ammonium assimilation properties, increased tolerance to ammonia toxicity, improved osmotic stress tolerance and improved composition. The present sequence represents the coding sequence of Chlorella sorokiniana NADP-glutamate dehydrogenase clone pBGDc53, used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Transforming a plant with a polynucleotide encoding a polypeptide with glutamate dehydrogenase activity provides a plant with modulated nitrogen metabolism useful to increase yield and ammonium and osmotic stress

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
The present invention relates to increasing or decreasing the nitrogen metabolism in plant cells by transforming a plant cell with a polypucleotide encoding a polypeptide having glutamate dehydrogenase (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GI (ADQ36707, ADQ36729), a beta subunit of NADP-specific GDH (ADQ36709, ADQ36731), or their fragments, which exhibits GDH activity. The polypucleotide is operably linked to a polypucleotide encoding a chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is usef for increasing or decreasing the nitrogen metabolism in plant cells. The
                                                                                                                                                   Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.
                                                                                                                                                                                                                                                                                                                             24-JUL-2003;
                                                                                                                                                                                                                                                                                                                                                                           US2004128710-A1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Chlorella
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nitrogen metabolism; plant;

858 900 methods, polynucleotides, and polypeptides are useful in producing plant with increased yield, and with improved tolerance to ammonia toxicity, osmotic stress, and composition of the proper or plant. The present sequence is the coding sequence for the precursor protein of the beta subunit of the NADP-specific GDH, which is then processed to produce the mature alpha subunit of the NADP-specific GDH, used in the method of the

Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.

Example 2, SEQ ID NO 18; 36pp; English.

The present invention relates to increasing or decreasing the nitrogen cc metabolism in plant cells by transforming a plant cell with a ccomplete control of NaDe specific GDH activity. The polypeptide is an alpha subunit of NaDe-specific GDH (ADQ36707, ADQ36729), a beta subunit of NADe-specific GDH (ADQ36709, CC (ADQ36707), or their fragments, which exhibits GDH activity. The cc polynucleotide is operably linked to a polypucleotide encoding a cc chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their fragments that exhibit chloroplast transit activity. The method is useful cf for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polynucleotides, and polypeptides are useful in producing plant cc sequence is a cDNA clone which was isolated during the invaction. The present cc sequence is a cDNA clone which was isolated during the isolation of the crop or plant. The present cc identified in an example from the invention. Sequence analysis revealed cc all ten clones were identical at their 3' termini and differed by varying degree of truncation at their 5' termini. Clone pBGDc53 (ADQ36712) was the longest clone and was found to have a complete 3' terminus, but was continued to determine the 5' terminal sequence using primers ADQ36713 ADQ36717 and ADQ36718), pRGDc 61 (ADQ36719), pGDc 63 (ADQ36721) and pGDc 64

Increasing or decreasing nitrogen metabolism in plant cells, for plant with increased yield and improved tolerance to ammonia toxicity and osmotic stress, by transforming plant cell with nucleic acid having glutamate dehydrogenase activity.

Example 2; SEQ ID NO 7; 36pp; English.

The present invention relates to increasing or decreasing the nitrogen CC metabolism in plant cells by transforming a plant cell with a CC polynucleotide encoding a polypeptide having glutamate dehydrogenase CC (GDH) activity. The polypeptide is an alpha subunit of NADP-specific GDH (ADQ36707, ADQ36702), a beta subunit of NADP-specific GDH (ADQ36709, CC ADQ36701, or their fragments, which exhibits GDH activity. The CC polynucleotide is operably linked to a polynucleotide encoding a CC chloroplast transit peptide comprising ADQ36710 or ADQ36711, or their CC fragments that exhibit chloroplast transit activity. The method is useful CC for increasing or decreasing the nitrogen metabolism in plant cells. The methods, polynucleotides, and polypeptides are useful in producing plant CC with increased yield, and with improved to armonia toxicity, CC osmotic stress, and composition of the crop or plant. The present CC with increased yield, and with improved to armonia toxicity, CC osmotic stress, and composition of the crop or plant. The present CC educatified in an example from the invention. Ten NADP-GDH clones were consultied in an example from the invention. Sequence analysis revealed CC all ten clones were identical at their 3' termini and differed by varying CC degree of truncation at their 5' termini. Clone pBGDc53 (ADQ36712) was CC the longest clone and was found to have a complete 3' terminus, but was not long enough to encode either NADP-GDH subunit and so PCR was carried cout to determine the 5' terminal sequence using primers ADQ36713-ADQ36717 and ADQ36719, pRGDc 61 (ADQ36719), pGDc 63 (ADQ36721) and pGDc 64 (ADQ36722) and the full-length clones ADQ36721 and ADQ36723 and ADQ36723 and ADQ36723.

Sequence 1, Application US/08828451

Sequence 1, Application US/08828451

Patent No. 5985634

GENERAL INFORMATION:
APPLICANT: Schmidt, Robert R.
APPLICANT: Miller, Philip
TITLE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLEOTIDES
TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF GLUTANJ
TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF GLUTANJ
CORRESPONDENCE ADDRESS:
ADDRESSEE: Saliwanchik & Saliwanchik
STREET: 2421 N.W. 41st Street, Suite A-1
CITY: Gainesville
STATE: Florida
COUNTRY: USA
ZIP: 32606
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION NUMBER: US/08/828,451
FTILTM: NATE:
                                                                                                                                                                                     ঠ
                                                                                                                                                                                                                                                8

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                 GENERAL INFORMATION:

APPLICANT: Schmidt, Philip

APPLICANT: Schmidt, Philip

TITLE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLEOTIDES

TITLE OF INVENTION: RELATING TO THE '- AND -SUBUNITS OF GLUTAMATE

TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF USE

NUMBER OF SEQUENCES: 26

CORRESPONDENCE ADDRESS:

ADDRESSEE: Saliwanchik & Saliwanchik

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 7, Application US/08828451
Patent No. 5985634

GENERAL INFORMATION:
APPLICANT: Schmidt, Robert R.
APPLICANT: Miller, Philip
TITLE OF INVENTION: NOVEL POLYPEPTIDES AND POLYNUCLEOTIDES
TITLE OF INVENTION: RELATING TO THE - AND -SUBUNITS OF GLU
TITLE OF INVENTION: DEHYDROGENASES AND METHODS OF USE
                                                                                                                                                                                                         Matches 1969;
